Carl L. Yaws

Each of the above series contains data for more than 1,000 organic compounds, including hydrocarbons, oxygenates, halogenates, nitrogenates, sulfur compounds, and silicon compounds. The data are presented in graphs for *vapor pressure, viscosity, thermal conductivity,* or *thermodynamics* as a function of temperature and are arranged by carbon number and chemical formula to enable the engineer to quickly determine values at the desired temperatures. Select series include wide ranges of inorganic compounds and elements.

Handbook of Transport Property Data (Product #5392)
Carl L. Yaws

Comprehensive data on viscosity, thermal conductivity, and diffusion coefficients of gases and liquids are presented in convenient tabular format.

Handbook of Chemical Compound Data for Process Safety (Product #5381)
Carl L. Yaws

Comprehensive safety and health-related data for hydrocarbons and organic chemicals and selected data for inorganic chemicals are provided in convenient tabular format supplemented by graphs and examples.

Physical Properties of Hydrocarbons
Volume 1, Second Edition (Product #5067)
Volume 2, Third Edition (Product #5175)
Volume 3 (Product #5176)
Volume 4 (Product #5272)
R. W. Gallant and Carl L. Yaws

The four-volume series provides chemical, environmental, and safety engineers with quick and easy access to vital physical property data needed for production and process design calculations.

Thermodynamic and Physical Property Data (Product #5031)
Carl L. Yaws

Property data for 700 major hydrocarbons and organic chemicals, including oxygen, nitrogen, fluorine, chlorine, bromine, iodine, and sulfur compounds, are provided.

Chapter 1

PHYSICAL PROPERTIES

Carl L. Yaws
Lamar University, Beaumont, Texas

ABSTRACT

Results for physical property data are presented for major hydrocarbons and organic chemicals. The physical properties include molecular weight, freezing point, boiling point, critical constants (temperature, pressure and volume), acentric factor and density. A wide range of compounds are covered including oxygen, nitrogen, chlorine, fluorine, bromine, sulfur, silicon and other chemical types.

PHYSICAL PROPERTIES

The results for physical properties are shown in Table 1-1. The results are presented in an easy-to-use tabular format which is especially applicable for rapid engineering usage with the personal computer or hand calculator. The tabulation is based on both experimental data and estimated values.

A comparison of estimates and data is shown in Figure 1-1 for critical temperature of normal alkanes. The graph discloses favorable agreement of estimates and data.

In the data collection, a literature search was conducted to identify data source publications (1-40). The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a data base of critical properties for compounds for which experimental data are available. The data base also served as a basis to check the accuracy of the estimation methods.

Upon completion of data collection, estimation of the critical properties for the remaining compounds was performed using the group contribution method of Joback as given by Reid, Prausnitz and Poling (24). A comparison of the estimates with experimental data was favorable with average absolute errors of only 0.9%, 6.3%, and 4.4% for critical temperature (465 compounds), pressure (453 compounds) and volume (345 compounds).

The normal boiling and freezing point temperatures in the table are based on experimental data for most of the compounds. For the compounds without data, the group contribution method of Joback (24) was used to estimate the boiling and freezing point temperatures. As discussed by Reid, Prausnitz and Poling (24), no reliable methods are available for precise estimation of freezing point temperature. Thus, the estimates for freezing point temperature should be considered as rough approximations.

COMPUTER PROGRAM

A computer program, containing the data for all compounds, is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program (random data file) is in ASCII which can be accessed by other software.

Computer program results for a representative compound are shown in Table 1-2.

Table 1-2 COMPUTER PROGRAM RESULTS

PHYSICAL PROPERTIES

1. Number.....		10
2. Formula.....		CCl4
3. Name.....		CARBON TETRACHLORIDE
4. Molecular Weight.... g/mol =		153.822
5. Freezing Point..... K =		250.33
6. Boiling Point..... K =		349.79
7. Critical Temp..... K =		556.35
8. Critical Pressure..... bar =		45.60
9. Critical Volume... cm3/mol =		276.0
10. Acentric Factor..... =		0.193
11. Density @ 25 C..... g/cm3 =		1.583

Chapter 2

VAPOR PRESSURE

Carl L. Yaws
Lamar University, Beaumont, Texas

ABSTRACT

Results for vapor pressure as a function of temperature are presented for major organic chemical compounds. The coefficients are displayed in an easy-to-use table which is especially applicable for rapid engineering usage with the personal computer or hand calculator. The organic chemicals encompass hydrocarbon, oxygen, nitrogen, halogen, silicon, sulfur and other chemical type compounds.

VAPOR PRESSURE

The Antoine-type equation with extended terms was selected for correlation of vapor pressure as a function of temperature:

$$\log_{10} P = A + B/T + C \log_{10} T + D T + E T^2 \qquad (2\text{-}1)$$

where P = vapor pressure, mm Hg
A,B,C,D and E = regression coefficients for chemical compound
T = temperature, K

The results for vapor pressure are given in Table 2-1. The tabulation is applicable to a wide variety of substances including hydrocarbons (alkanes, olefins, acetylenes, cycloalkanes, ...); oxygenates (alcohols, aldehydes, ketones, acids, ethers, glycols, anhydrides, ...); halogenates (chlorinated, brominated, fluorinated and iodinated compounds); nitrogenates (nitriles, amines, cyanates, amides, ...); sulfur compounds (mercaptans, sulfides, sulfates, ...); silicon compounds (silanes, chlorosilanes, ...) and many other chemical types. The temperature range for which the equation may be used to predict vapor pressure is denoted by the respective minimum and maximum temperatures.

The last column in the table provides the vapor pressure of each substance at 25 C (77 F). These data are especially valuable in engineering applications at ambient conditions.

A comparison of calculated values and experimental data for vapor pressure is shown in Figure 2-1 for a representative chemical. The graph indicates good agreement of calculations and data.

In preparing the tabulation, a literature search was conducted to identify data source publications (1-35). The publications were screened for appropriate data. The compilation resulting from the screening is based on both experimental data and estimated values. In the absence of experimental data, estimates were primarily based on Riedel equation and on adjusting the A value in the equation to match the boiling point temperature of the compound. The estimates of the other coefficients for the compound were based on the same values of the compound's brother (closest member of same chemical family). Experimental data and estimates were then regressed to provide the same equation for all compounds.

EXAMPLES

The tabulated values maybe used for prediction and calculation of vapor pressure. Examples are shown in Table 2-2.

COMPUTER PROGRAM

A computer program, containing the coefficients for vapor pressure for all compounds, is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program (random data file) is in ASCII which can be accessed by other software.

Computer program results for a representative compound are shown in Table 2-3.

Table 2-2 EXAMPLES

Example 1 Estimate the vapor pressure of methanol (CH4O) at a temperature of 25.13 C (298.28 K).

Substitution of the coefficients and temperature into the equation for vapor pressure yields:

$$\log_{10} P = 45.6171 - 3.2447E+03/298.28 - 1.3988E+01*\log_{10}(298.28) + 6.6365E-03*298.28 - 1.0507E-13*298.28^2$$

$$= 2.1034$$

$$P = 126.88 \text{ mm Hg}$$

The calculated and data values compare favorably (126.88 vs 127.90, deviation = 0.80%).

Example 2 Estimate the vapor pressure of acetone (C3H60) at a temperature of 47.35 C (320.50 K).

Substitution of the coefficients and temperature into the equation for vapor pressure yields:

$$\log_{10} P = 28.5884 - 2.4690E+03/320.50 - 7.3510E+00*\log_{10}(320.50) + 2.8025E-10*320.50 + 2.7361E06*320.50^2$$

$$= 2.7456$$

$$P = 556.71 \text{ mm Hg}$$

The calculated and data values compare favorably (556.71 vs 558.40, deviation = 0.30%).

Chapter 3

EXPLOSIVE LIMITS IN AIR

Carl L. Yaws, Sachin D. Sheth and Mei Han
Lamar University, Beaumont, Texas

ABSTRACT

Results for lower and upper explosive (flammable) limits in air are presented for major organic chemical compounds. The results are displayed in an easy-to-use table which is especially applicable for rapid engineering usage. The organic chemicals encompass hydrocarbon, oxygen, nitrogen, halogen, silicon, sulfur and other chemical type compounds.

EXPLOSIVE LIMITS IN AIR

The results for lower (LEL) and upper (UEL) explosive limits in air are presented in Table 3-1. The LEL and UEL values are the lower and upper concentrations (expressed as volume %) for flammability. The tabulation also provides the freezing and boiling point temperatures which are helpful in determining whether the substance is a gas, liquid or solid at ambient conditions. The tabulation is based on both experimental data and estimated values.

A comparison of estimates and data is shown in Figure 3-1 for normal alkanes. The graph discloses favorable agreement.

In the data collection, a literature search was conducted to identify data source publications (1-59). The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a data base for which experimental data are available. The data base also served as a basis to check the accuracy of the estimation methods.

Upon completion of data collection, estimation of values for the remaining compounds was performed. The estimates are primarily based on the methods of Shebeko (16) and Jones (2). The Jones method (regression of the stoichiometric concentrations for volume % fuel in fuel plus air) is shown below:

$$C_mH_xO_y + z\,O_2 \text{ -----> } m\,CO_2 + x/2\,H_2O$$

$$LEL,\ \% = 0.55\,(100)/(4.76m + 1.19x + 1 - 2.38y) \quad (3\text{-}1)$$

$$UEL,\ \% = 3.50\,(100)/(4.76m + 1.19x + 1 - 2.38y) \quad (3\text{-}2)$$

Evaluation of the above equations with normal alkanes disclosed favorable agreement of estimates and data. For lower explosive limit, very favorable agreement was experienced for small, intermediate and large size alkanes. For upper explosive limit, rough agreement was experienced for small and large size alkanes. More favorable agreement was experienced for intermediate size alkanes.

The lower and upper explosive limits in air are often needed for gas mixtures. The Le Chatelier equation (2) for gas mixtures is:

$$LEL_{mixture},\ \% = 1 / \Sigma\,(y_i/LEL_i) \quad (3\text{-}3)$$

$$UEL_{mixture},\ \% = 1 / \Sigma\,(y_i/UEL_i) \quad (3\text{-}4)$$

where y_i = mole fraction of component i on a combustible basis

EXAMPLES

The tabulated values maybe used in engineering applications involving pure components and mixtures in air. Examples are shown in Table 3-2.

COMPUTER PROGRAM

A computer program, containing the data for all compounds, is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program (random data file) is in ASCII which can be accessed by other software.

Computer program results for a representative compound are shown in Table 3-3.

CODE 1 - experimental
2 - estimated

Table 3-2 EXAMPLES

Example 1 A process vessel contains n-pentane (C5H12) at a concentration of 2 vol % in air.

Are the contents of the vessel flammable?

Inspection of the table discloses that LEL = 1.4 vol % for n-pentane. Since the vessel contents exceed the LEL for n-pentane, the contents are flammable. This is shown below:

Vessel contents of 2 vol % > LEL of 1.4 vol %

Vessel contents are flammable.

Example 2 Estimate the lower (LEL) and upper (UEL) explosive limits in air for the gas mixture below:

	vol %	y_i (combustible basis)	LEL_i	UEL_i
Methane	1	0.2	5.0	15.0
Ethane	2	0.4	3.0	12.5
Propane	2	0.4	2.1	9.5
Air	95	---	---	---

Substitution of y_i, LEL_i and UEL_i into the equations for gas mixtures provides:

$$LEL_{mixture} = 1 / \Sigma(y_i/LEL_i) = 1/(0.2/5 + 0.4/3 + 0.4/2.1)$$

$$\underline{LEL_{mixture} = 2.75 \text{ vol } \%}$$

$$UEL_{mixture} = 1 / \Sigma(y_i/UEL_i) = 1/(0.2/15 + 0.4/12.5 + 0.4/9.5)$$

$$\underline{UEL_{mixture} = 11.4 \text{ vol } \%}$$

Chapter 4

FLASH POINT AND AUTOIGNITION TEMPERATURES

Carl L. Yaws, Sachin D. Sheth and Mei Han
Lamar University, Beaumont, Texas

ABSTRACT

Results for flash point and autoignition temperatures are presented for major organic chemical compounds. The organic chemicals encompass hydrocarbon, oxygen, nitrogen, halogen, silicon, sulfur and other chemical type compounds. The results are displayed in an easy-to-use table which is especially applicable for rapid engineering usage.

FLASH POINT AND AUTOIGNITION TEMPERATURES

The results for flash point and autoignition temperatures are given in Table 4-1. The flash point represents the temperature at which the liquid gives off enough vapor to flash (combust) when exposed to an external ignition source. The autoignition temperature is the temperature at which the substance will automatically ignite (combust) without an external ignition source. Freezing and boiling point temperatures are also provided in the tabulation to help in determining whether the substance is a gas, liquid or solid at ambient conditions. The tabulation is based on both experimental data and estimated values.

A comparison of estimates and data is shown in Figure 4-1 for normal alkanes. The graph discloses favorable agreement.

In the data collection, a literature search was conducted to identify data source publications (1-86). The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a data base for which experimental data are available. The data base also served as a basis to check the accuracy of the estimation methods.

Upon completion of data collection, estimation of values for the remaining compounds was performed. The estimates are primarily based on the methods of Shebeko (22), Gmehling and Rasmussen (23) and vapor pressure methods. The vapor pressure method is based on determining the temperature at which the vapor pressure will provide an equilibrium concentration that is equal to the lower explosive limit (LEL) concentration in air. The equations are briefly given below:

$$y_i = P_i/P = LEL_i/100 \tag{4-1}$$

where
y_i = vapor concentration of component i, mole fraction
P_i = vapor pressure of component i, atm
P = total pressure, atm
P_i/P = equilibrium concentration of component i, mole fraction
$LEL_i/100$ = lower explosive limit concentration of component i, mole fraction

Evaluation of the vapor pressure method with normal alkanes disclosed favorable agreement of estimates and data for small, intermediate and large size molecules. Evaluation with other compound types was not performed. If the lower explosive limit (LEL) used in the calculations is estimated, the estimates for flash point should be considered as rough values.

EXAMPLES

The tabulated values maybe used in engineering applications involving pure components in air. Examples are shown in Table 4-2.

COMPUTER PROGRAM

A computer program, containing the data for all compounds, is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program (random data file) is in ASCII which can be accessed by other software.

Computer program results for a representative compound are shown in Table 4-3.

Table 4-2 EXAMPLES

Example 1 A process vessel at a temperature of 80 F contains liquid toluene (C7H8) in contact with air.

Is the vapor in the process vessel flammable?

Inspection of the table discloses that the flash point is 40 F for toluene. Since the temperature of the process vessel contents exceeds the flash point for toluene, the vapor is flammable. This is shown below:

Vessel temperature of 80 F > Flash point of 40 F

Vapor in vessel is flammable.

Example 2 A small quantity of residual n-tetradecane (C14H30) is in the piston bore of a piston-type compressor. If air at ambient conditions is compressed to 570 psia and 420 F, will the n-tetradecane undergo autoignition?

Inspection of the table discloses that the autoignition temperature of n-tetradecane is 392 F. Since the temperature of 420 F at the end of the compression exceeds the autoignition temperature, autoignition of the n-tetradecane will occur. This is shown below:

Compressor temp. of 420 F > Autoignition temp. of 392 F

Autoignition of n-tetradecane will occur.

Table 4-3 COMPUTER PROGRAM RESULTS

FLASH POINT AND AUTOIGNITION TEMPERATURES

---

1. Number..... 680
2. Formula..... C7H8
3. Name..... TOLUENE
4. Molecular Weight..... = 92.141
5. Freezing Point..... F = -138.95
6. Boiling Point..... F = 231.13
7. Code for Flash Point..... = 1
8. Flash Point..... F = 40
9. Code for Autoignition Temperature.. = 1
10. Autoignition Temperature..... F = 997

Chapter 5

ENTHALPY OF COMBUSTION

Carl L. Yaws, Sachin D. Sheth and Mei Han
Lamar University, Beaumont, Texas

ABSTRACT

Results for enthalpy of combustion are presented for major organic chemical compounds. The results are displayed in an easy-to-use table which is especially applicable for rapid engineering usage. The organic chemicals encompass hydrocarbon, oxygen, nitrogen, halogen, silicon, sulfur and other chemical type compounds.

ENTHALPY OF COMBUSTION

The enthalpy of combustion is the net increase in heat content when a substance in its standard state at ambient conditions (77 F, 1 atm) undergoes complete oxidation. The results for enthalpy of combustion are presented in Table 5-1. The tabulated values are the negative of the enthalpy of combustion. A positive value as shown means that heat is released in the combustion. A negative value means that heat is required for the combustion. For substances in the table, the products of combustion are CO2 (gas), H2O (gas), F2 (gas), Cl2 (gas), Br2 (gas), I2 (gas), N2 (gas), SO2 (gas), H3PO4 (solid) and SiO2 (crystobalite). The tabulation also provides the freezing and boiling point temperatures which are helpful in determining whether the substance is a gas, liquid or solid at ambient and near ambient conditions.

In the data collection, a literature search was conducted to identify data source publications (1-95) for the table. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a data base for use in preparing the table.

EXAMPLES

The tabulated values maybe used in engineering applications involving combustion. Examples are shown in Table 5-2.

COMPUTER PROGRAM

A computer program, containing the data for all compounds, is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program (random data file) is in ASCII which can be accessed by other software.

Computer program results for a representative compound are shown in Table 5-3.

NOTE:

1. The enthalpy of combustion applies at 77 F and 1 atm.
2. The tabulated values are the negative of the enthalpy of combustion. A positive value as shown means that heat is released. A negative value means that heat is required.
3. For compounds in the table, the products of combustion are CO2 (gas), H2O (gas), F2 (gas), Cl2 (gas), Br2 (gas), I2 (gas), N2 (gas), SO2 (gas), H3PO4 (solid) and SiO2 (crystobalite).

Table 5-2 EXAMPLES

Example 1 Combustion of propane (C3H8, 50 kg/hr) occurs at ambient conditions (77 F, 1 atm).

Estimate the quantity of heat released in the combustion.

Substitution of the tabulated value for propane into the equation below provides the quantity of heat released:

$\Delta H = (-\Delta H_{combustion})(mass)$

$= (46{,}333 \text{ kjoule/kg})(50 \text{ kg/hr})$

$\Delta H = 2.32$ million kjoule/hr

Example 2 Combustion of n-hexane (C6H14, 150 lb/hr) occurs at ambient conditions (77 F, 1 atm).

Estimate the quantity of heat released in the combustion.

Substitution of the tabulated value for n-hexane into the equation below provides the quantity of heat released:

$\Delta H = (-\Delta H_{combustion})(mass)$

$= (19{,}236.4 \text{ BTU/lb})(150 \text{ lb/hr})$

$\Delta H = 2.89$ million BTU/hr

Table 5-3 COMPUTER PROGRAM RESULTS

ENTHALPY OF COMBUSTION

---

1. Number..... 598
2. Formula..... C6H14
3. Name..... n-HEXANE
4. Molecular Weight..... = 86.177
5. Freezing Point..... F = -139.56
6. Boiling Point..... F = 155.71
7. State..... = liquid
8. - Enthalpy of Combustion...kjoule/mol = 3855.2
9. - Enthalpy of Combustion....kjoule/kg = 44735.8
10. - Enthalpy of Combustion.....BTU/lb = 19236.4

The enthalpy of combustion applies at 77 F and 1 atm.
The numerical values as shown are the negative of the enthalpy of combustion. A positive value means that heat is released in in the combustion. A negative value means that heat is required. The products of combustion are CO2 (gas), H2O(gas), F2(gas), Cl2 (gas), Br2 (gas), I2 (gas), N2 (gas), SO2 (gas), H3PO4 (solid) and SiO2 (crystobalite) for substances in the datafile.

Chapter 6

EXPOSURE LIMITS FOR HEALTH

Carl L. Yaws, Sachin D. Sheth and Mei Han
Lamar University, Beaumont, Texas

ABSTRACT

Results for recommended and permissible exposure limits in air for safeguarding health are presented for major organic chemical compounds. The results are displayed in an easy-to-use table which is especially applicable for rapid engineering usage. The organic chemicals encompass hydrocarbon, oxygen, nitrogen, halogen, silicon, sulfur and other chemical type compounds.

EXPOSURE LIMITS FOR SAFEGUARDING HEALTH

The results for recommended (REL) and permissible (PEL) exposure limits in air for safeguarding health in the workplace are presented in Table 6-1. The REL value is the recommended exposure limit by the NIOSH (National Institute for Occupational Safety and Health). The PEL value is the permissible exposure limit for maintaining health as provided by OSHA (Occupational Safety and Health Act). Both REL and PEL values apply to a 40 hour workweek. The last column in the tabulation provides IDLH (immediately dangerous to life or health) values. The tabulation also provides the freezing and boiling point temperatures which are helpful in determining whether the substance is a gas, liquid or solid at ambient conditions.

Threshold limit values (TLV) which also apply to a 40 hour workweek are published by the American Conference of Governmental Industrial Hygienists. The PEL values of OSHA are frequently based on the TLV values issuing from the American Conference of Governmental Industrial Hygienists (7).

In the data collection, a literature search was conducted to identify data source publications (1-15) for the table. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a data base for use in preparing the tabulation.

If more than one substance is present in the workplace, then exposure limits are needed for gas mixtures. The following equation (1) maybe used for exposure limits of gas mixtures:

$$PEL_{mixture} = \Sigma\, y_i \,/\, \Sigma\, (y_i/PEL_i) \qquad (6\text{-}1)$$

where $PEL_{mixture}$ = permissible exposure limit of mixture, ppm

y_i = mole fraction of component i, ppm

EXAMPLES

The tabulated values maybe used in engineering applications involving exposure of pure components and mixtures in the workplace. Examples are shown in Table 6-2.

COMPUTER PROGRAM

A computer program, containing the data for all compounds, is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program (random data file) is in ASCII which can be accessed by other software.

Computer program results for a representative compound are shown in Table 6-3.

NOTE:

1. Recommended and permissible exposure limits (REL and PEL values) apply for 40 hour workweek.
2. REL and PEL values are time weighted average concentrations.
3. ppm - parts per million by volume.
4. mg/m^3 - milligrams per cubic meter (68 F, 1 atm)
5. NIOSH - National Institue for Occupational Safety and Health.
6. OSHA - Occupational Safety and Health Act.
7. Threshold limit values (TLV) which also apply to a 40 hour workweek are published by the American Conference of Governmental Industrial Hygientists. The PEL values of OSHA are frequently based on the TLV values issuing from the American Conference of Governmental Industrial Hygientists (7).

Table 6-2 EXAMPLES

Example 1 Due to a small leak, the workplace contains methylamine (CH5N) at a concentration of 13.7 ppm (parts per million, volume) in air.

Are the workers overexposed?

Inspection of the table discloses that the permissible exposure level (PEL) = 10 ppm for methylamine. Since the workplace concentraion exceed the PEL for methylamine, the workers are overexposed. This is shown below:

Workplace concentraion of 13.7 ppm > PEL of 10 ppm

Workers are overexposed.

Example 2 Estimate the permissible exposure level (PEL) for the gas mixture below:

	y_i	PEL_i
	ppm	ppm
Acetonitrile (C2H3N)	10	40
Ethylamine (C2H7N)	2	10
Monoethanolamine (C2H7NO)	2	3

Substitution of y_i and PEL_i into the equations for gas mixtures provides:

$$PEL_{mixture} = \Sigma\ y_i\ /\ \Sigma\ (y_i/PEL_i)$$

$$= (10 + 2 + 2\ )/(10/40 + 2/10 + 2/3)$$

$$PEL_{mixture} = 12.5 \text{ ppm}$$

Table 6-3 COMPUTER PROGRAM RESULTS

EXPOSURE LIMITS FOR HEALTH

---

1. Number..... 75
2. Formula..... C3H5Cl
3. Name..... 3-CHLOROPROPENE
4. Molecular Weight..... = 76.525
5. Freezing Point..... F = -210.10
6. Boiling Point..... F = 112.93
7. Recommended Exposure Limit (NIOSH), ppm..... = 1
8. Permissible Exposure Limit (OSHA), ppm..... = 1
9. Immediately Dangerous to Life/Health, ppm.... = 250

---

ppm - parts per million, volume.
mg/m3 - milligrams per cubic meter.
NIOSH - National Institute of Occupational Safety and Health.
OSHA - Occupational Safety and Health Act.

PEL - Permissible Exposure Limit.
IDLH - Immediately Dangerous to Life/Health.
PEL values are often identical to Threshold Limit Values (TLV).

Chapter 7

COEFFICIENT OF THERMAL EXPANSION

Carl L. Yaws
Lamar University, Beaumont, Texas

ABSTRACT

Results for thermal expansion coefficient of liquids are presented for major organic chemicals. The results are especially helpful in the design of relief systems for process equipment containing liquids that are subject to thermal expansion.

The correlation constants are displayed in an easy-to-use tabular format which is especially suited for rapid engineering usage with the personal computer or hand calculator. Correlation and experimental results are in favorable agreement.

INTRODUCTION

Physical and thermodynamic property data, such as thermal expansion coefficient, are important in process engineering. The following brief discussion illustrates such importance. Liquids contained in process equipment will expand with an increase in temperature. To accommodate such expansion, it is necessary to design a relief system which will relieve (or vent) the thermally expanding liquid and prevent pressure build-up from the expansion. If provisions are not made for a relief system, the pressure will increase from the thermally expanding liquid. If the pressure increase is excessive, damage to the process equipment will occur.

In this article, results are presented for thermal expansion coefficient of liquids. The results are useful in process engineering applications including the design of relief systems for process equipment containing liquids that are subject to thermal expansion.

THERMAL EXPANSION COEFFICIENT

The following equation was selected for correlation of thermal expansion coefficient of liquid as a function of temperature:

$$\beta_{liq} = a\,(1-T/T_C)^m \qquad (7\text{-}1)$$

where β_{liq} = thermal expansion coefficient of liquid, 1/C
a and m = regression coefficients for chemical compound
T = temperature, K
T_C = critical temperature, K

The results for thermal expansion coefficient are given in Table 7-1 for major organic chemicals. The presented values are applicable to a wide variety of substances. The tabulation also discloses the temperature range for which the equation is useable. The respective minimum and maximum temperatures are denoted by TMIN and TMAX. Spot values are provided at 25 C for both thermal expansion coefficient and liquid density.

For the tabulation, a literature search was conducted to identify data source publications (1-30). The publications were screened and copies of appropriate data were made. These data were next keyed-in to the computer to provide a data base of liquid volume values for organic compounds for which experimental data are available. These data were then regressed for volume and change of volume with temperature as a function of

temperature.

The coefficient of thermal expansion involves both volume and change of volume with temperature. The variation of volume with temperature is shown in Figure 7-1 for a representative compound. Inspection of the figure discloses that the curve at constant pressure (P=29.6 atm) is very similar in shape to the curve at saturation (P=saturation). In fact, the curves are roughly parallel for the range shown. Also, the closeness of the curves indicates that the volume is about the same for both saturation and constant pressure as shown. These observations of similar shape and closeness suggest that the coefficient of thermal expansion at constant pressure is approximately equal to that at saturation:

$$\beta_{liq} = \frac{1}{v}\left(\frac{\partial v}{\partial T}\right)_p \approx \frac{1}{v}\left(\frac{\partial v}{\partial T}\right)_{saturation} \tag{7-2}$$

This equation was used in preparing the tabulated results. The equation is applicable to the liquid at conditions below the critical point (temperature below critical temperature and pressure below critical pressure).

A comparison of calculated and actual data values for thermal expansion coefficient of liquid in Figure 7-2 for a representative compound. The graph indicates good agreement of calculated and data values.

VOLUMETRIC EXPANSION RATE

Crowl and Louvar (9) have shown that the volumetric expansion (or flow) rate for a liquid contained in process equipment that undergoes thermal expansion from heat input is given by:

$$Q_v = \frac{\beta_{liq}}{\rho_{liq} C_P} UA (T_{ext} - T) \tag{7-3}$$

where
Q_v = volumetric expansion rate
ρ_{liq} = density of liquid
C_P = heat capacity of liquid
U = overall heat transfer coefficient
A = area for heat transfer
T_{ext} = external temperature
T = temperature of liquid

This equation describes the volumetric expansion rate at the beginning of the heat transfer and is applicable for the design of relief systems. The relief system should be sized to accommodate this volumetric flow (9). Property data for use in the equation are available from Yaws (29,30).

EXAMPLES

The correlation results maybe used for calculation of thermal expansion coefficient of liquid and volumetric flow from thermal expansion. Examples are shown in Table 7-2.

COMPUTER PROGRAM

A computer program, containing data for all compounds, is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program (random data file) is in ASCII which can be accessed by other software.

Computer program results for a representative compound are shown in Table 7-3.

Portions of this material appeared in Chemical Engineering, pp. 98-104, August, 1995 (copyright by McGraw-Hill) and is reprinted by special permission.

Table 7-2 EXAMPLES

Example 1

Estimate the thermal expansion coefficient of liquid for n-pentane (C5H12) at 40 C.

Substitution of the correlation constants from the table and temperature into the correlation equation yields

$$\beta_{liq} = 7.883E\text{-}04\ (1-(40+273.15)/469.65)^{.7179}$$

$$\underline{\beta_{liq} = 0.00174\ C^{-1}}$$

Example 2

Estimate the thermal expansion coefficient of liquid for n-butane (C4H10) at 40 C.

Substitution of the correlation constants from the table and temperature into the correlation equation yields

$$\beta_{liq} = 8.757E\text{-}04\ (1-(40+273.15)/425.18)^{.7137}$$

$$\underline{\beta_{liq} = 0.00227\ C^{-1}}$$

Example 3

The tubing in a reactor contains benzene (C6H6) at 25 C (76.7 F). Other data are:

heat capacity of liquid (C_P)	0.413 BTU/lb-F
overall heat transfer coefficient (U)	40 BTU/hr-ft^2-F
surface area of tubing (A)	500 ft^2

Estimate the volumetric expansion rate if the tubing is exposed to 500 F superheated steam.

Substitution of the spot values at 25 C (β_{liq}=1.137E-03 C^{-1} and ρ_{liq}=0.873 g/cm^3) from the table into the volumetric expansion equation yields:

$$Q_v = \frac{1.137E\text{-}03\ C^{-1}/(1.8\ F/C)}{(0.873\ g/cm^3\ 62.4\ lb/ft^3/g/cm^3)(0.413\ BTU/lb\text{-}F)}\ (40\ BTU/hr\text{-}ft^2\text{-}F)(500\ ft^2)\ (500\text{-}76.7)\ F$$

$$\underline{Q_v = 237.69\ ft^3/hr = 29.63\ gal/min}$$

The relief system should be designed to accommodate this volumetric flow.

Chapter 8

THERMODYNAMIC PROPERTIES FOR EXPLOSION CALCULATIONS

Carl L. Yaws, Sachin D. Sheth and Mei Han
Lamar University, Beaumont, Texas

ABSTRACT

Thermodynamic properties for explosion calculations are presented for major organic chemical compounds. The thermodynamic properties include enthalpy of formation, Gibbs free energy of formation, internal energy of formation and Helmholtz free energy of formation. The major chemicals include hydrocarbon, oxygen, nitrogen, sulfur, fluorine, chlorine, bromine, iodine and other compound types.

EXPLOSION ENERGY AND THERMODYNAMIC PROPERTIES

The energy of an explosion involves work of expansion ($dW = PdV$) resulting from the explosion (1,2). As the expansion occurs, this energy is transferred from the explosion. At constant temperature, the change in Helmholtz free energy ($dA = -PdV$) is related to such expansion work. Thus, it is convenient to utilize the change in Helmholtz free energy to ascertain the energy of an explosion:

$$\text{Explosion Energy}_{\text{limit}} = -\Delta A \tag{8-1}$$

Since thermal effects and irreversibility are involved in an explosion, this equation represents a limiting or maximum value for the explosion energy.

For an explosion reaction, the change in Helmholtz free energy maybe determined from Helmholtz free energy of formation for the products and reactants according to equation given below:

$$\Delta A = \Sigma\,(n\Delta A_f)_{\text{products}} - \Sigma\,(m\Delta A_f)_{\text{reactants}} \tag{8-2}$$

The actual energy release in an explosion will be less than the limiting value given by the change in Helmholtz free energy because of thermal effects and irreversibility. In an example in Crowl and Louvar (1), 12% of the limiting value is suggested for a vapor cloud explosion in a partially confined area (ethylene explosion in a ditch). For vapor cloud explosion in an unconfined area, 2% of the limiting value is suggested by the same authors.

The results for Helmholtz free energy of formation are presented in Table 8-1. The values for Helmholtz free energy of formation are useful in ascertaining the explosion energy of reactions. Other thermodynamic properties are also provided in the tabulation. The values for enthalpy of formation are useful in determining the heat effects of explosion reactions. Values for Gibbs free energy of formation are useful in ascertaining the thermodynamic equilibrium. The values for the internal energy of formation are useful in determining the internal energy changes for explosion reactions.

In the data collection, a literature search was conducted to identify data source publications (1-21) for the table. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a data base for use in preparing the tabulation.

EXAMPLE

The tabulated values for thermodynamic properties are useful in engineering applications involving explosion reactions. An example is shown in Table 8-2.

COMPUTER PROGRAM

A computer program, containing the data for all compounds, is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program (random data file) is in ASCII which can be accessed by other software.

Computer program results for a representative compound are shown in Table 8-3.

Portions of this material appeared in Chemical Engineering, pp. 81-88, Sept. 26, 1988 (copyright 1988 by McGraw-Hill, New York, New York) and Hydrocarbon Processing, pp. 81-84, Nov., 1988 (copyright 1988 by Gulf Publishing Co., Houston , Texas). These portions are reprinted by special permission.

NOTE:

1. ΔH_f - Enthalpy of formation
2. ΔG_f - Gibbs free energy of formation
3. ΔU_f - Internal energy of formation
4. ΔA_f - Helmholtz free energy of formation
5. kJ/mol - kilojoule/mol

Table 8-2 EXAMPLE

Example A vapor cloud containing ethylene in air is ignited in a ditch (partially confined area):

$$C_2H_4 + 3\ O_2 \text{ ------> } 2\ CO_2 + 2\ H_2O$$

Determine the following for the explosion reaction:

(a) The change in Helmholtz free energy

(b) The energy of the explosion by assuming 12% of the change in Helmholtz free energy

Substitution of the tabulated values and the value for water (ΔA_f = -227.36 kJ/mol for H_2O) into the equation below provides the change in Helmholtz free energy:

$$\Delta A = \Sigma\ (n\Delta A_f)_{products} - \Sigma\ (m\Delta A_f)_{reactants}$$

$$= 2(-394.38) + 2(-227.36) - (70.59 + 3(0))$$

$$= -788.76 - 454.72 - 70.59$$

$$\underline{\Delta A = -1314.07 \text{ kJ/mol}}$$

Assuming 12% of the change in Helmholtz free energy is manifested in the explosion, substitution into the equation below provides the energy of the explosion:

$$\text{Explosion Energy} = 12\%\ (-\Delta A)$$

$$= 0.12\ (1314.07)$$

$$\underline{\text{Explosion Energy} = 157.69 \text{ kJ/mol}}$$

Appendix A

CONVERSION TABLES

1. Temperature

To convert from Centigrade to:
- Kelvin, add 273.15
- Rankine, multiply Kelvin by 1.8
- Fahrenheit, multiply Centigrade by 1.8 and add 32

2. Pressure

To convert from psia to:
- kPa, multiply by 6.895
- psig, subtract 14.7
- mm Hg, multiply by 51.71
- atmospheres, divide by 14.7
- bars, divide by 14.508

3. Heat of Vaporization

To convert from kJ/kg to:
- BTU/lb, multiply by 0.43
- cal/gram, multiply by 0.239

4. Density

To convert from g/ml to:
- lb/ft^3, multiply by 62.43
- lb/gallon, multiply by 8.345

5. Surface Tension

To convert from dynes/cm to:
- N/m, multiply by 0.001

6. Heat Capacity

To convert from J/g K to:
- BTU/lb R, multiply by 0.239
- cal/gram K, multiply by 0.239

7. Viscosity

To convert from micropoise to:
- lb/ft s, multiply by 0.0672E-06
- centipoise, multiply by 1.0E-04
- poise, multiply by 1.0E-06
- Pa s (pascal seconds), multiply by 1.0E-07

To convert from centipoise to:
- lb/ft s, multiply by 0.000672
- micropoise, multiply by 10,000
- poise, multiply by 0.01
- Pa s (pascal seconds), multiply by 0.001

8. Thermal Conductivity

To convert from W/m K to:
- BTU/hr ft R, multiply by 0.5770
- calorie/cm s K, multiply by 0.002388

9. Enthalpy of Formation

To convert from kJ/mol to:
- kcal/mol, multiply by 0.239

10. Gibbs Free Energy of Formation

To convert from kJ/mol to:
- kcal/mol, multiply by 0.239

11. Internal Energy of Formation

To convert from kJ/mol to:
- kcal/mol, multiply by 0.239

12. Helmholtz Free Energy of Formation

To convert from kJ/mol to:
- kcal/mol, multiply by 0.239

THERMODYNAMIC PROPERTIES FOR EXPLOSION CALCULATIONS - INORGANIC COMPOUNDS

Carl L. Yaws, Sachin D. Sheth and Mei Han
Lamar University, Beaumont, Texas

ABSTRACT

Thermodynamic properties for explosion calculations are presented for inorganic chemical compounds. The thermodynamic properties include enthalpy of formation, Gibbs free energy of formation, internal energy of formation and Helmholtz free energy of formation. The inorganic chemicals include Ag - Zr compounds.

EXPLOSION ENERGY AND THERMODYNAMIC PROPERTIES

The energy of an explosion involves work of expansion ($dW = PdV$) resulting from the explosion (1,2). As the expansion occurs, this energy is transferred from the explosion. At constant temperature, the change in Helmholtz free energy ($dA = -PdV$) is related to such expansion work. Thus, it is convenient to utilize the change in Helmholtz free energy to ascertain the energy of an explosion:

$$\text{Explosion Energy}_{\text{limit}} = -\Delta A \tag{B-1}$$

Since thermal effects and irreversibility are involved in an explosion, this equation represents a limiting or maximum value for the explosion energy.

For an explosion reaction, the change in Helmholtz free energy maybe determined from Helmholtz free energy of formation for the products and reactants according to equation given below:

$$\Delta A = \Sigma\,(n\Delta A_f)_{\text{products}} - \Sigma\,(m\Delta A_f)_{\text{reactants}} \tag{B-2}$$

The actual energy release in an explosion will be less than the limiting value given by the change in Helmholtz free energy because of thermal effects and irreversibility. In an example in Crowl and Louvar (1), 12% of the limiting value is suggested for a vapor cloud explosion in a partially confined area (ethylene explosion in a ditch). For vapor cloud explosion in an unconfined area, 2% of the limiting value is suggested by the same authors.

The results for Helmholtz free energy of formation are presented in Table B-1. The values for Helmholtz free energy of formation are useful in ascertaining the explosion energy of reactions. Other thermodynamic properties are also provided in the tabulation. The values for enthalpy of formation are useful in determining the heat effects of explosion reactions. Values for Gibbs free energy of formation are useful in ascertaining the thermodynamic equilibrium. The values for the internal energy of formation are useful in determining the internal energy changes for explosion reactions.

In the data collection, a literature search was conducted to identify data source publications (1-30) for the table. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a data base for use in preparing the table.

COMPUTER PROGRAM

A computer program, containing the data for all compounds, is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program (random data file) is in ASCII which can be accessed by other software.

Computer program results for a representative compound are shown in Table B-2.

Appendix C

EXPOSURE LIMITS FOR HEALTH - INORGANIC COMPOUNDS

Carl L. Yaws, Sachin D. Sheth and Mei Han
Lamar University, Beaumont, Texas

ABSTRACT

Results for recommended and permissible exposure limits in air for safeguarding health are presented for major inorganic chemical compounds. The results are displayed in an easy-to-use table which is especially applicable for rapid engineering usage. The inorganic chemicals encompass Ag - Zr compounds.

EXPOSURE LIMITS FOR SAFEGUARDING HEALTH

The results for recommended (REL) and permissible (PEL) exposure limits in air for safeguarding health in the workplace are presented in Table C-1. The REL value is the recommended exposure limit by the NIOSH (National Institute for Occupational Safety and Health). The PEL value is the permissible exposure limit for maintaining health as provided by OSHA (Occupational Safety and Health Act). Both REL and PEL values apply to a 40 hour workweek. The last column in the tabulation provides IDLH (immediately dangerous to life or health) values. The tabulation also provides the freezing and boiling point temperatures which are helpful in determining whether the substance is a gas, liquid or solid at ambient conditions.

Threshold limit values (TLV) which also apply to a 40 hour workweek are published by the American Conference of Governmental Industrial Hygienists. The PEL values of OSHA are frequently based on the TLV values issuing from the American Conference of Governmental Industrial Hygienists (7).

In the data collection, a literature search was conducted to identify data source publications (1-15) for the table. The publications were screened and copies of appropriate data were made. These data were then keyed into the computer to provide a data base for use in preparing the tabulation.

If more than one substance is present in the workplace, then exposure limits are needed for gas mixtures. The following equation (1) maybe used for exposure limits of gas mixtures:

$$PEL_{mixture} = \Sigma\, y_i \,/\, \Sigma\, (y_i/PEL_i) \qquad \text{(C-1)}$$

where $PEL_{mixture}$ = permissible exposure limit of mixture, ppm

y_i = mole fraction of component i, ppm

COMPUTER PROGRAM

A computer program, containing the data for all compounds, is available for a nominal fee (Carl L. Yaws, Box 10053, Lamar University, Beaumont, TX 77710, phone/FAX 409-880-8787). The computer program (random data file) is in ASCII which can be accessed by other software.

Computer program results for a representative compound are shown in Table C-2.

NOTE:

1. Recommended and permissible exposure limits (REL and PEL values) apply for 40 hour workweek.
2. REL and PEL values are time weighted average concentrations.
3. ppm - parts per million by volume.
4. mg/m^3 - milligrams per cubic meter (68 F, 1 atm)
5. NIOSH - National Institue for Occupational Safety and Health.
6. OSHA - Occupational Safety and Health Act.
7. Threshold limit values (TLV) which also apply to a 40 hour workweek are published by the American Conference of Governmental Industrial Hygientists. The PEL values of OSHA are frequently based on the TLV values issuing from the American Conference of Governmental Industrial Hygientists (7).

Table C-2 COMPUTER PROGRAM RESULTS

EXPOSURE LIMITS FOR HEALTH

---

1. Number..... 34
2. Formula..... HF
3. Name..... HYDROGEN FLUORIDE
4. Molecular Weight..... = 20.006
5. Freezing Point..... F = -118.05
6. Boiling Point..... F = 67.14
7. Recommended Exposure Limit (NIOSH), ppm..... = 3
8. Permissible Exposure Limit (OSHA), ppm..... = 3
9. Immediately Dangerous to Life/Health, ppm.... = 30

---

ppm - parts per million, volume.
mg/m3 - milligrams per cubic meter.
NIOSH - National Institute of Occupational Safety and Health.
OSHA - Occupational Safety and Health Act.
REL - Recommended Exposure Limit.
PEL - Permissible Exposure Limit.
IDLH - Immediately Dangerous to Life/Health.
PEL values are often identical to Threshold Limit Values (TLV).

2. Very limited experimental data for critical constants and acentric factor are available for inorganic compounds and elements which are solids at room temperature. Thus, the estimates for these substances should be considered rough approximations in the absence of experimental data.
